

# Nano Filter

Designed from a woven mesh structure, the Nano filter candle is created for optimal filtration. This unique structure helps the candle resist blocking, maintain peak flow rate. This filter helps to remove 99.9% of bacteria, viruses and other contaminants.

- Able to fit into our reusable filter housing
- Made from a nano fine carbon permeated glass fibre material, which is tightly folded to create a larger surface area
- Helps to maintain a high flow rate, even at low water pressures
- Nano filters also reduce the risk of blocking if the mains supply is peaty or dirty
- Can be disposed of with household waste
